Related PR URL: Not available because the Event Registration feature has not yet been implemented or submitted as a feature pull request.

2. Feature context

Selected Feature= The selected feature is Event Registration for the Meraki Arts Africa Website.

User= The primary user is a visitor who wants to register for an upcoming Meraki Arts Africa event.

Requirement= The system should allow visitors to register for upcoming events by submitting their personal information and selecting an available event.

User Story= As a visitor, I want to register for an upcoming event so that I can participate in Meraki Arts Africa activities.

Acceptance Criteria

The visitor can view available events.

The visitor can select an event.

The visitor can enter the required registration details.

The system validates the submitted information.

The system prevents duplicate registration for the same event.

The system prevents registration when an event has reached its capacity.

A successful registration produces a confirmation message.

Why the feature matters to the client= Event registration is important because Meraki Arts Africa organizes events and needs a structured way for interested participants to register. The feature can reduce manual registration work and provide the organization with an organized record of participants. The feature is currently planned and has not yet been fully implemented by the team.

3. Test case table

Test Case	Type	Starting Condition	Action	Test Data	Expected Result	Evidence
TC01	Normal case	Event exists and has available spaces	Submit a valid registration	Ama Mensah, ama.mensah@example.com , EVT001	Registration is accepted and confirmation is displayed	Planned screenshot of successful registration
TC02	Invalid input	Registration form is open	Submit form with invalid email	ama.mensah@	System rejects the input and displays an email validation error	Planned screenshot of validation message
TC03	Edge case	Event has one remaining space	Two users attempt to register	EVT001 with capacity reached	Only the available space is accepted; additional registration is rejected	Planned registration/capacity evidence
TC04	Authorization/security	Registration records exist	Unauthorized visitor attempts to access another participant's registration	Participant ID PAR001	Access is denied	Planned authorization test evidence
TC05	Failure/dependency case	Database is	Submit a valid	Valid synthetic participant and event data	System reports an error and	Planned error/log evidence

		unavailab le	registratio n		does not create a partial registratio n	
TC06	Regression case	Registrati on feature has previousl y passed testing	Repeat a valid registratio n after another feature change	Valid synthetic participant and event	Registratio n continues to work without breaking existing functionali ty	Planned regression test evidence

4. Test data

Only synthetic data is used for the planned tests.

Example synthetic participant

Name: Ama Mensah

Email: ama.mensah@example.com

Phone: 0241234567

Example synthetic event

Event ID: EVT001

Event: Art Exhibition 2026

Capacity: 100

5. PR review walkthrough

No feature PR is currently available because Event Registration has not yet been implemented. Therefore, a planned PR review checklist is used. So before merging an Event Registration PR, the reviewer should check the following

Requirement fit= Does the implementation satisfy the Event Registration user story?

Validation

Are required fields validated?

Is the email format checked?
Is duplicate registration prevented?
Is event capacity checked?

Testing

Are normal, invalid, edge, security, failure, and regression cases tested?
Are tests included for important business rules?

Data risk

Are participant records stored correctly?
Are foreign key or relationship constraints handled correctly?
Is unnecessary personal information avoided?

Security

Can unauthorized users access participant information?
Are administrative functions protected?
Are credentials and sensitive configuration kept out of the source code?

Documentation

Does the PR explain what was changed?
Are important design decisions documented?

AI disclosure

If AI-assisted code was used, was it reviewed and tested by the team?
Is the use of AI disclosed appropriately?

System impact

Could the changes affect existing event, gallery, contact, or other website functionality?
Has regression testing been considered?

6. CI evidence or CI plan

The Event Registration feature has not yet been implemented, so there is currently no meaningful CI result specifically for this feature. Therefore, a **CI plan** is provided instead. The team's CI workflow should run automatically whenever code is pushed to the repository or when a pull request is created.

Planned CI commands

The CI workflow should include commands appropriate to the project's actual setup, such as:

make setup
make lint
make test
make build

CI evidence

The expected CI evidence should include:

GitHub Actions workflow run, Evidence that dependencies were installed successfully, Linting results, Automated test results, Successful application build, Final workflow status showing Passed.

7. Failure or defect walkthrough

Selected failure: Duplicate Event Registration

Failure type: Business-rule failure

Description

A likely defect is allowing the same participant to register for the same event more than once. This would violate the requirement that a participant should only have one registration for a particular event.

How to reproduce the failure

Open the Event Registration form, Select an available event, such as **EVT001- Art Exhibition 2026**.

Enter valid participant details:

Name: Ama Mensah

Email: ama.mensah@example.com

Phone: 0241234567 .Submit the registration, Confirm that the registration is successfully created. submit the same participant details for the same event again, Observe the system response.

Expected behaviour

The system should identify that the participant has already registered for the selected event. The second registration attempt should be rejected and an appropriate message should be displayed, such as: "You are already registered for this event." No second registration record should be created.

What the user would see if the defect occurs

If the defect exists, the user would be able to submit the form successfully a second time. The system could display another success message even though the participant is already registered. This could result in duplicate participant records or duplicate registration records.

9. AI was used to help structure and improve the documentation, test cases, PR review checklist, and CI plan. I reviewed and edited the content to match my project and verified that I understood the requirements, testing approach, failure scenario, and CI process. The final understanding and explanations are my own.
